Community as an Enabler of Scientific Progress and Innovation

IAS lunchtime seminar (November 9, 2026)

"...aim of this IAS major project is to investigate the role of communities as drivers of scientific progress with the key objective to enable better community engagement to unlock more effective and efficient scientific progress and innovation…"

Co PIs: David Alexander (Physics: astronomer) and Sara L. Uckelman (Philosophy: logician)

IAS fellows: Jarita Holbrook (Edinburgh: Michaelmas 2026), Marion Maisonobe (Paris: Michaelmas 2027)
IAS visiting scholar: Rhodri Leng (Edinburgh) and also 15 project partners

Durham University
Institute of Advanced Study

Supported by the Institute for Advanced Studies, Durham University, https://www.iasdurham.org/

What is a community?

External vs. internal approaches to “community”

- external/etic: sociological and anthropological approaches to ‘community,’ defined and viewed from the outside
- internal/emic: internal approaches to community, defined and viewed by the members of the community themselves

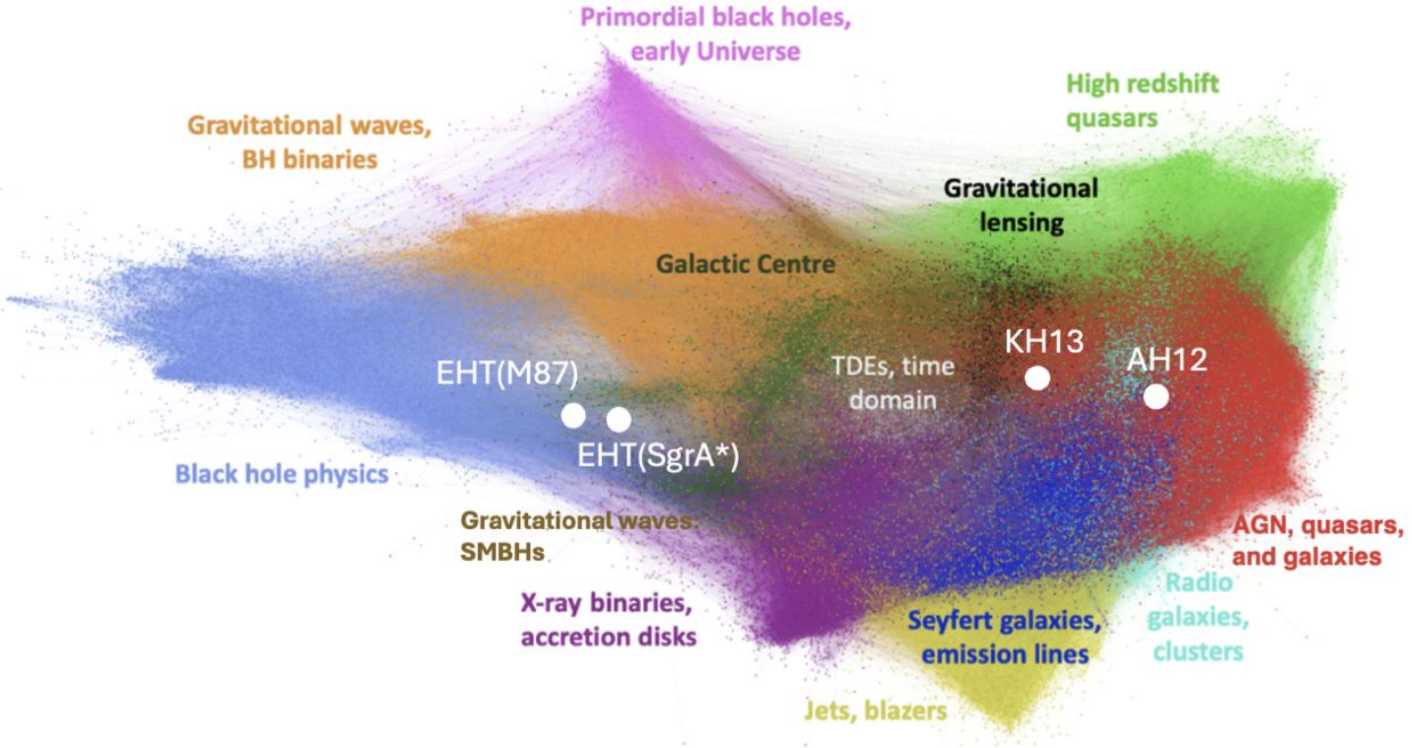

Scientific and research communities

- defined as groups of people who share something in common, e.g., research interests, lab space, disciplinary label
- exist on many different levels: broad international networks encompassing entire disciplines; sub-disciplines connected through specific areas of research; departmental/institutional/administrative groups; specific research projects connected to a single team.

Example: levels of research communities in quantum physics

Classification	**Example(s)**
Research discipline	physics
Research field	quantum light & matter
Research subfield	Rydberg systems
Research groups/labs	Strontium lab, Cuprite lab, Terahertz lab

An example: the black-hole research community

Citation network diagram for all research over last 20 years on “black holes” produced by Dr Rhodri Leng (IAS visiting scholar)

Project themes

- **Operations and culture**
  - day to day activities
  - tools and resources

- **Communication and discussions**
  - meetings
  - publishing

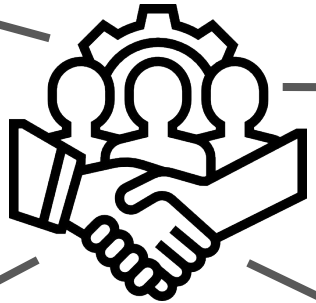

Thanks to Eucalup through Flaticons and Dreamstime for the icons

Ongoing project strands: operations and culture

Care in the scientific research community

Community engagement: UK astronomy community through fish-pool discussion sessions

The IAS as a case study

“Little Red Dot” research: operations of a community under pressure

Thanks to Eucalup through Flaticons and Dreamstime for the icons

Care in the Research Community

Tronto's fourfold care-ethics framework:

Type of care	**General manifestation**
caring about	attentiveness
caring for / taking care of	responsibility
caregiving	competence
care receiving	responsiveness

Care in the Research Community

- How are these types of care manifest in research communities, esp. scientific ones?
- Is the language of care manifest in these research communities?
- What are the barriers to introducing the language of care into these communities?
- How do we get people to care about caring?

Ongoing project strands: communication and discussions

"It depends on what you mean": How do we talk to each other?

The effectiveness of research meetings: conferences, workshops, and symposia

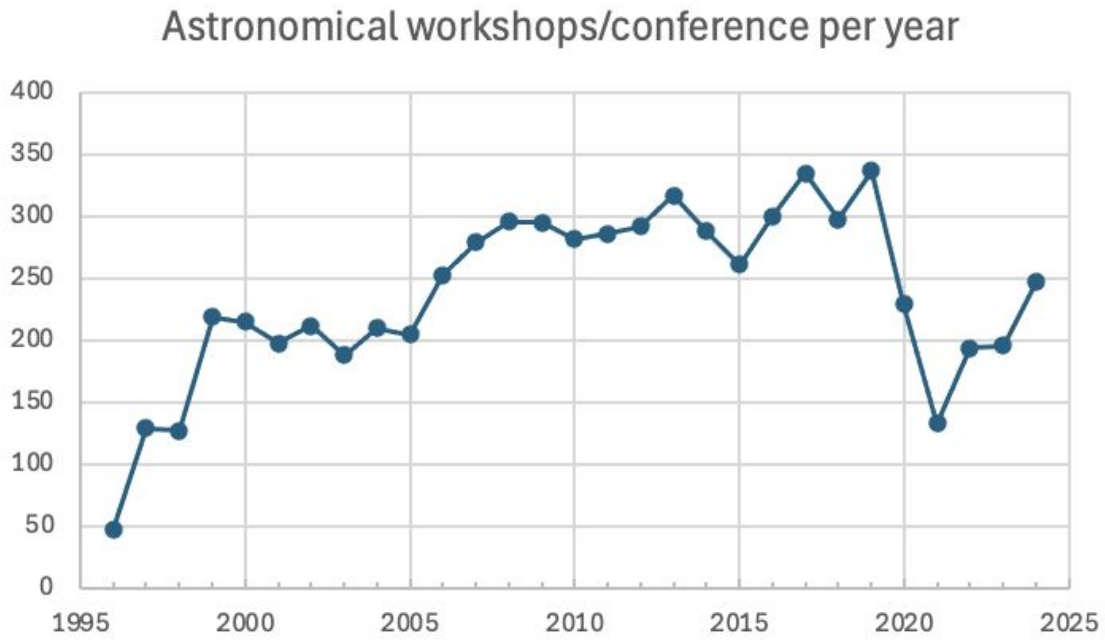

Conflict resolution: How do we navigate high-stakes communication?

Thanks to Eucalup through Flaticons and Dreamstime for the icons

The effectiveness of research meetings: case for astronomy

Too many scientific meetings!

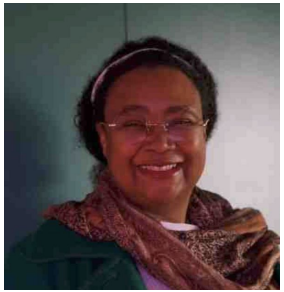

Worse: too many are “show and tell” meetings

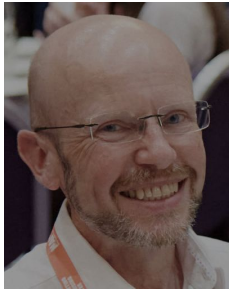

Not enough effective research discussion, moving forward the field

The effectiveness of research meetings: case for astronomy

Ongoing projects within this strand:

- **Science advancement in workshops and conferences:** case study on a recent Lorentz Center workshop
- **Meeting organisation guidelines:** selecting the right approach depending on the intended outcome
- **Challenging the community:** facilitating a workshop on understanding “Little Red Dots”, a highly **competitive and combative** black-hole research community
